

# Differential Temperature Control

The Welvent Differentiated Control Unit, WDC is a simple control unit designed for use where anything is cooled with ambient air. The controller sensors measure the inside/product temperature and compares it with the ambient temperature, and if outside is cold enough it starts the fan.

The WDC Benefits from:

- Easy to use push buttons
- Frost Protection Facility
- Variable differential
- Product target temp

Suitable for use in grain stores, small potato stores, or anywhere that requires simple differential temperature control.
