Centrifugal Fans

Welvents new range of centrifugal fans offer outstanding performance. The range is not just the same selection of fans that have been used for the last 30 years. They utilise the most efficient modern backward curved impellers selected to make the optimum use of the motor power to provide the maximum output of air at the operating pressure for your grain store. They also have a big back pressure reserve, for those extra wet crops when the big new combines have to roll. The extra output comes from more efficient impeller designs and clever computer design technology to give a difference that has to be experienced to be believed.

Welvent also offer a range of portable fan units for smaller applications

Insulated Fan house complete with insulated air inlet

Fan Layout

The fans can be provided in a conventional layout or in an increasingly more popular way, the down discharge type which can be used in a fan house above the duct inside the store. This reduces the building cost and reduces noise levels.

Noise Reduction

If noise is an issue then the fans can be selected at low noise levels or an encased fan can be provided, Welvent offer a range of silencers or sound reduction techniques.
